l doc/refcard/refcard.tex

Octave Quick Reference Octave Version 3.0.0

Starting Octave

| octave | start interactive Octave session |
|----------------------|----------------------------------|
| ${	t octave} \ file$ | run Octave on commands in file |
| octaveeval | codeEvaluate code using Octave |
| octavehelp | describe command line options |

exit Octave

Stopping Octave

| INTERRUPT | (e.g. C-c) terminate current command |
|--------------|--------------------------------------|
| | and return to top-level prompt |
| Cotting Holp | |

Getting Help

quit or exit

| help | list all commands and built-in variables |
|---------------------|--|
| help command | briefly describe command |
| doc | use Info to browse Octave manual |
| doc command | search for command in Octave manual |
| ${	t lookfor}\ str$ | search for $command$ based on str |
| | |

Motion in Info

| SPC or C-v | scroll forward one screenful |
|------------|-------------------------------|
| DEL or M-v | scroll backward one screenful |
| C-1 | redraw the display |

Node Selection in Info

| n | select the next node |
|-------|---|
| p | select the previous node |
| u | select the 'up' node |
| t | select the 'top' node |
| d | select the directory node |
| < | select the first node in the current file |
| > | select the last node in the current file |
| g | reads the name of a node and selects it |
| C-x k | kills the current node |

Searching in Info

| C-s | search forward incrementally |
|-----|---|
| C-r | search backward incrementally |
| i | search index & go to corresponding node |
| | go to next match from last 'i' command |

search for a string

Command-Line Cursor Motion

| C-b | move back one character |
|-----|--|
| C-f | move forward one character |
| C-a | move to the start of the line |
| С-е | move to the end of the line |
| M-f | move forward a word |
| M-b | move backward a word |
| C-1 | clear screen, reprinting current line at top |

Inserting or Changing Text

| insert a tab character |
|--|
| delete character to the left of the cursor |
| delete character under the cursor |
| add the next character verbatim |
| transpose characters at the point |
| transpose words at the point |
| |

surround optional arguments ... show one or more arguments

Killing and Yanking

| C-k | kill to the end of the line |
|-------|---|
| С-у | yank the most recently killed text |
| M-d | kill to the end of the current word |
| M-DEL | kill the word behind the cursor |
| M-y | rotate the kill ring and yank the new top |

Command Completion and History

| TAB | complete a command or variable name |
|--|--|
| M-? | list possible completions |
| RET | enter the current line |
| C-p | move 'up' through the history list |
| C-n | move 'down' through the history list |
| M-< | move to the first line in the history |
| M-> | move to the last line in the history |
| C-r | search backward in the history list |
| C-s | search forward in the history list |
| $\texttt{history} \; \left[\text{-q} \right] \left[N \right]$ | list N previous history lines, omitting history numbers if $\neg q$ |
| $\verb history -w [file] $ | write history to file (~/.octave_hist if no file argument) |
| $\verb history -r [file] $ | <pre>read history from file (~/.octave_hist is no file argument)</pre> |
| ${\tt edit_history}\ lines$ | edit and then run previous commands |
| | from the history list |

run_history lines run previous commands from the history

[beg] [end] Specify the first and last history commands to edit or run.

If beg is greater than end, reverse the list of commands before editing. If end is omitted, select commands from beg to the end of the history list. If both arguments are omitted, edit the previous item in the history list.

Shell Commands

| $\mathtt{cd}\ dir$ | change working directory to dir |
|----------------------------------|--|
| pwd | print working directory |
| ${\tt ls} \left[options\right]$ | print directory listing |
| getenv (string) | return value of named environment variable |
| system (cmd) | execute arbitrary shell command string |

Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by one or more newlines. Elements of a matrix may be arbitrary expressions, assuming all the dimensions agree.

| Γ | x, | y, |] | $_{\rm enter}$ | a | row vector |
|---|----|----|----------|----------------|--------------|------------------------|
| | x; | y; |] | $_{\rm enter}$ | \mathbf{a} | ${\rm column\ vector}$ |
| Г | w, | x; | y, z] | $_{\rm enter}$ | a | 2×2 matrix |

Multi-dimensional Arrays

Multi-dimensional arrays may be created with the cat or reshape commands from two-dimensional sub-matrices.

| squeeze (arr) | remove singleton dimensions of the array. |
|--------------------|---|
| ndims (arr) | number of dimensions in the array. |
| permute (arr, p) | permute the dimensions of an array. |
| ipermute (arr, p) | array inverse permutation. |

shiftdim (arr, s) rotate the array dimensions. circshift (arr, s) rotate the array elements.

Sparse Matrices

```
sparse (...)
                   create a sparse matrix.
speye (n)
                   create sparse identity matrix.
sprand (n, m, d) sparse rand matrix of density d.
spdiags (...)
                   sparse generalization of diag.
nnz(s)
                   No. nonzero elements in sparse matrix.
```

```
Ranges
base: limit
base: incr: limit
Specify a range of values beginning with base with no
elements greater than limit. If it is omitted, the default
value of incr is 1. Negative increments are permitted.
```

Strings and Common Escape Sequences

A string constant consists of a sequence of characters enclosed in either double-quote or single-quote marks. Strings in double-quotes allow the use of the escape sequences below.

```
11
                    a literal backslash
\"
                    a literal double-quote character
\,
                    a literal single-quote character
\n
                    newline, ASCII code 10
\t
                    horizontal tab, ASCII code 9
```

Index Expressions

| var(idx) | select elements of a vector |
|------------------|--|
| var (idx1, idx2) | select elements of a matrix |
| scalar | select row (column) corresponding to |
| | scalar |
| vector | select rows (columns) corresponding to |
| | the elements of vector |
| range | select rows (columns) corresponding to |
| | the elements of range |
| | select all rows (columns) |

Global and Persistent Variables

| global $var1$ | Declare variables global. |
|-----------------------|---|
| $global \ var1 = val$ | Declare variable global. Set initial value. |
| persistent $var1$ | Declare a variable as static to a function. |
| persistent var1 = | Declare a variable as static to a function |
| val | and set its initial value. |
| Global variables ma | by be accessed inside the body of a |
| function without ha | wing to be passed in the function |
| parameter list provi | ided they are declared global when used. |

Selected Built-in Functions

| EDITOR | editor to use with edit_history | |
|--------------------------|--|---|
| Inf, NaN | IEEE infinity, NaN | |
| NA | Missing value | |
| PAGER | program to use to paginate output | |
| ans | last result not explicitly assigned | |
| eps | machine precision | |
| pi | π | |
| 1i realmax realmin | $\begin{array}{c} \sqrt{-1} \\ \text{maximum representable value} \\ \text{minimum representable value} \end{array}$ | |
| Copyright 1996, 1997 | 2007 John W. Eaton Permissions on bac | k |

Assignment Expressions

| v | var = expr | assign | expression to variable |
|---|----------------------|-----------------|--------------------------------|
| v | var (idx) = expr | assign | expression to indexed variable |
| v | var(idx) = [] | $_{\rm delete}$ | the indexed elements. |
| v | $var \{idx\} = expr$ | assign | elements of a cell array. |

Arithmetic and Increment Operators

```
addition
x - y
                     subtraction
x * y
                     matrix multiplication
                     element by element multiplication
x \cdot * y
x / y
                     right division, conceptually equivalent to
                      (inverse (y') * x')'
x \cdot / y
                      element by element right division
                     left division, conceptually equivalent to
x \setminus y
                      inverse (x) * v
                      element by element left division
x \cdot y
x \hat{y}
                     power operator
                     element by element power operator
x \cdot \hat{y}
- x
                     negation
+ x
                     unary plus (a no-op)
_{x} ,
                     complex conjugate transpose
x .
                     transpose
++ x (-- x)
                     increment (decrement), return new value
x ++ (x --)
                     increment (decrement), return old value
```

Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

```
x < y
                    true if x is less than y
x \le y
                    true if x is less than or equal to y
x == y
                    true if x is equal to y
                    true if x is greater than or equal to y
x \ge y
x > y
                    true if x is greater than y
x != y
                    true if x is not equal to y
x & y
                    true if both x and y are true
x \mid y
                    true if at least one of x or y is true
                    true if bool is false
! bool
```

Short-circuit Boolean Operators

Operators evaluate left-to-right. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Operands are converted to scalars using the all function.

```
true if both x and y are true
x && u
x \mid \mid y
                     true if at least one of x or y is true
```

Operator Precedence

Table of Octave operators, in order of increasing precedence.

```
statement separators
                    assignment, groups left to right
|| &&
                   logical "or" and "and"
l &
                    element-wise "or" and "and"
< <= == >= > !=
                    relational operators
                    colon
                    addition and subtraction
                   multiplication and division
                    transpose
                    unary minus, increment, logical "not"
                    exponentiation
```

Paths and Packages

path display the current Octave function path. pathdef display the default path. addpath (dir) add a directory to the path. EXEC_PATH manipulate the Octave executable path.

pkg list display installed packages. pkg load pack Load an installed package.

Cells and Structures

 $var.field = \dots$ set a field of a structure. $var\{idx\} = \dots$ set an element of a cell array. cellfun (f, c)apply a function to elements of cell array.

fieldnames (s) returns the fields of a structure.

Statements

for $identifier = expr \ stmt$ -list endfor

Execute stmt-list once for each column of expr. The variable identifier is set to the value of the current column during each iteration.

while (condition) stmt-list endwhile

Execute stmt-list while condition is true.

break exit innermost loop continue go to beginning of innermost loop

return return to calling function

if (condition) if-body [else else-body] endif

Execute if-body if condition is true, otherwise execute elsebody.

if (condition) if-body elseif (condition) elseif-body endif Execute if-body if condition is true, otherwise execute the elseif-body corresponding to the first elseif condition that is true, otherwise execute else-body.

Any number of elseif clauses may appear in an if

unwind_protect body unwind_protect_cleanup cleanup end

Execute body. Execute cleanup no matter how control exits body.

try body catch cleanup end

Execute body. Execute cleanup if body fails.

Strings

strcmp(s, t)compare strings strcat (s, t, \ldots) concatenate strings regexp (str, pat) strings matching regular expression

regexprep (str, pat, rep) Match and replace sub-strings

Defining Functions

function [ret-list] function-name [(arg-list)] function-body endfunction

ret-list may be a single identifier or a comma-separated list of identifiers delimited by square-brackets.

arg-list is a comma-separated list of identifiers and may be empty.

Function Handles

QfuncDefine a function handle to func. @(var1, ...) expr Define an anonymous function handle. str2func (str) Create a function handle from a string. functions Return information about a function (handle) handle. func2str (handle) Return a string representation of a function handle. handle (arg1, ...) Evaluate a function handle. feval (func, arg1, Evaluate a function handle or string, ...) passing remaining args to func Anonymous function handles take a copy of the variables in the current workspace.

Miscellaneous Functions

eval (str) evaluate str as a command error (message) print message and return to top level warning (message) print a warning message clear variables matching pattern clear pattern check existence of variable or function exist (str)who, whos list current variables whos vardetails of the variable var

Basic Matrix Manipulations

rows (a) return number of rows of a columns (a) return number of columns of a all (a) check if all elements of a nonzero check if any elements of a nonzero any (a)find (a) return indices of nonzero elements sort (a) order elements in each column of a sum(a)sum elements in columns of aprod (a) product of elements in columns of a min (aras) find minimum values max (args) find maximum values rem (x, y)find remainder of x/yreshape (a, m, n) reformat a to be m by n diag (v, k)create diagonal matrices linspace (b, l, n) create vector of linearly-spaced elements logspace (b, l, n) create vector of log-spaced elements eye (n, m)create n by m identity matrix ones (n, m)create n by m matrix of ones zeros (n, m)create n by m matrix of zeros rand (n, m)create n by m matrix of random values

Linear Algebra

| O | |
|-------------------|--|
| chol (a) | Cholesky factorization |
| det (a) | compute the determinant of a matrix |
| eig(a) | eigenvalues and eigenvectors |
| expm (a) | compute the exponential of a matrix |
| hess (a) | compute Hessenberg decomposition |
| inverse (a) | invert a square matrix |
| norm(a, p) | compute the p -norm of a matrix |
| pinv(a) | compute pseudoinverse of a |
| qr (a) | compute the QR factorization of a matrix |
| rank (a) | matrix rank |
| ${	t sprank}$ (a) | structural matrix rank |
| schur (a) | Schur decomposition of a matrix |
| svd (a) | singular value decomposition |
| syl(a, b, c) | solve the Sylvester equation |
| | |

Equations, ODEs, DAEs, Quadrature

*fsolve solve nonlinear algebraic equations *lsode integrate nonlinear ODEs *dassl integrate nonlinear DAEs *auad integrate nonlinear functions perror (nm, code) for functions that return numeric codes, print error message for named function and given error code

* See the on-line or printed manual for the complete list of arguments for these functions.

Signal Processing

fft (a) Fast Fourier Transform using FFTW ifft (a) inverse FFT using FFTW freaz (aras) FIR filter frequency response filter (a, b, x)filter by transfer function conv(a, b)convolve two vectors hamming (n)return Hamming window coefficients hanning (n)return Hanning window coefficients

Image Processing

colormap (map)set the current colormap gray2ind (i, n)convert gray scale to Octave image image (imq, zoom) display an Octave image matrix imagesc (img, zoom) display scaled matrix as image imread (file) load an image file imshow (img, map) display Octave image imshow (i, n)display gray scale image imshow (r, g, b)display RGB image imwrite (img, file) write images in various file formats ind2gray (img, map) convert Octave image to grav scale ind2rgb (imq, map) convert indexed image to RGB rgb2ind (r, a, b)convert RGB to Octave image save a matrix to file

open file name

C-style Input and Output

fopen (name, mode) close filefclose (file) printf (fmt, ...) formatted output to stdout fprintf (file, fmt, ...) formatted output to file sprintf (fmt, ...) formatted output to string scanf(fmt)formatted input from stdin fscanf (file, fmt) formatted input from file sscanf (str, fmt) formatted input from string fgets (file, len) read len characters from file fflush (file) flush pending output to file ftell (file) return file pointer position frewind (file) move file pointer to beginning freport print a info for open files read binary data files fread (file, size, prec) fwrite (file, size, prec) write binary data files feof (file) determine if pointer is at EOF

A file may be referenced either by name or by the number returned from fopen. Three files are preconnected when Octave starts: stdin, stdout, and stderr.

Other Input and Output functions

save file var ... save variables in file

load file disp (var)

load variables from file display value of var to screen

Polynomials

compan (p)companion matrix conv(a, b)convolution deconv(a, b)deconvolve two vectors create polynomial from a matrix poly (a) polyderiv (p) derivative of polynomial polyreduce (p) integral of polynomial polyval (p, x)value of polynomial at xpolyvalm (p, x)value of polynomial at xroots (p) polynomial roots residue (a, b) partial fraction expansion of ratio a/b

Statistics

corrcoef (x, y)correlation coefficient cov(x, y)covariance mean(a)mean value median (a) median value std (a) standard deviation var (a) variance

Plotting Functions

plot (args) 2D plot with linear axes plot3 (args) 3D plot with linear axes line (args) 2D or 3D line patch (args) 2D patch semilogx (args) 2D plot with logarithmic x-axis semilogy (args) 2D plot with logarithmic y-axis loglog (args) 2D plot with logarithmic axes

bar (args) plot bar charts stairs (x, y)plot stairsteps stem (x, y)plot a stem graph hist (y, x)plot histograms contour (x, y, z) contour plot title (string) set plot title axis (limits) set axis ranges xlabel (string) set x-axis label ylabel (string) set y-axis label zlabel (string) set z-axis label text (x, y, str)add text to a plot legend (string) set label in plot key grid on off set grid state

hold [on off] set hold state

ishold return 1 if hold is on, 0 otherwise

plot 3D surface mesh (x, y, z)

meshgrid (x, y)create mesh coordinate matrices
